Modern JAVA : Functional Programming Oct 23 2021 Java New LTS has released in September 2021. Time to take a quick tour through the new features that developer can enjoy after upgrading from 11 to 17. Note that many more improvements have been made under the hood - this article focuses on those features that can be directly used by most developers: Switch Expressions (JEP 361) Text Blocks (JEP 378) Packaging Tool (JEP 392) Pattern Matching for instanceof (JEP 394) Records (JEP 395) Sealed Classes (JEP 409) 1.1 A Bit of History The Java® programming language is a general-purpose, concurrent, object-oriented language. Its syntax is similar to C and C++, but it omits many of the features that make C and C++ complex, confusing, and unsafe. The Java platform was initially developed to address the problems of building software for networked consumer devices. It was designed to support multiple host architectures and to allow secure delivery of software components. To meet these requirements, compiled code had to survive transport across networks, operate on any client, and assure the client that it was safe to run. The popularization of the World Wide Web made these attributes much more interesting. Web browsers enabled millions of people to surf the Net and access media-rich content in simple ways. At last there was a medium where what you saw and heard was essentially the same regardless of the machine you were using and whether it was connected to a fast network or a slow modem. Web enthusiasts soon discovered that the content supported by the Web's HTML document format was too limited. HTML extensions, such as forms, only highlighted those limitations, while making it clear that no browser could include all the features users wanted. Extensibility was the answer. The HotJava browser first showcased the interesting properties of the Java programming language and

platform by making it possible to embed programs inside HTML pages. Programs are transparently downloaded into the browser along with the HTML pages in which they appear. Before being accepted by the browser, programs are carefully checked to make sure they are safe. Like HTML pages, compiled programs are network- and host-independent. The programs behave the same way regardless of where they come from or what kind of machine they are being loaded into and run on.

The fixed point iteration discussed is well controlled and have freedom to input a seed value, number of iterations etc. and to check the accuracy digits. No differentiations, No need of any theorems like Newton Raphson
15 digit stabilization by iteration: Within fraction of second, we can achieve a 15 digit stabilization, which means ultimate numerical capability of computers utilized by this method. Thousands of such solving loops in single worksheet: There is no limits on how many such equations can be independently solved. Your system memory decides the upper limit of thousands of equations that you can handle in a single sheet
No manual intervention needed after equations and algorithms set up
Simple, no-complication algorithms
No 'Divide by zero' error
For those who wont believe macros and VBAs - A clean worksheet concept!
A new version of this book is available: Solving Colebrook Equation for Pipe Design, Sizing and Optimisation Calculations: Solve Within Excel Worksheet - No VBA, MACRO, UDF of SOLVER

The New Modern JAVA : A Guide to New functional programming Nov 23 2021 The Java® programming language is a general-purpose, concurrent, object-oriented language. Its syntax is similar to C and C++, but it omits many of the features that make C and C++ complex, confusing, and unsafe. The Java platform was initially developed to address the problems of building software for networked consumer devices. It was designed to support multiple host architectures and to allow secure delivery of software components. To meet these requirements, compiled code had to survive transport across networks, operate on any client, and assure the client that it was safe to run. The popularization of the World Wide Web made these attributes much more interesting. Web

browsers enabled millions of people to surf the Net and access media-rich content in simple ways. At last there was a medium where what you saw and heard was essentially the same regardless of the machine you were using and whether it was connected to a fast network or a slow modem. Web enthusiasts soon discovered that the content supported by the Web's HTML document format was too limited. HTML extensions, such as forms, only highlighted those limitations, while making it clear that no browser could include all the features users wanted. Extensibility was the answer. The HotJava browser first showcased the interesting properties of the Java programming language and platform by making it possible to embed programs inside HTML pages. Programs are transparently downloaded into the browser along with the HTML pages in which they appear. Before being accepted by the browser, programs are carefully checked to make sure they are safe. Like HTML pages, compiled programs are network- and host-independent. The programs behave the same way regardless of where they come from or what kind of machine they are being loaded into and run on.
