Handbook on fish age determination: a Mediterranean experience **June 27 2019** This handbook provides guidance on methods for use in fish ageing studies. Fish age, among other biological parameters, is one of the most relevant of data to attain sustainable exploitation levels of fishery resources. Indeed, most analytical methods used in stock assessment require knowledge of demographic structure according to age of stocks, as well as to recruitment, maturity, natural mortality, etc., which are strictly linked to information on age and age structure. The handbook put together to deal with identified gaps – which affect both the precision and the accuracy of estimations – re ageing schemes, criteria and methodologies used in preparing calcified structures. It focuses on the general principles that underpin age analysis (assignment of birth date, preparation methods, aging scheme reading and identification of true and false rings). Crucially, it aims to contribute to the establishment of common analysis methods, which can enable better calibration across the diverse institutes involved, thereby improving the quality and reliability of results.

This approach is called co-management. This handbook describes the process of community-based co-management from its beginning, through implementation, to turnover to the community. It provides ideas, methods, techniques, activities, checklists, examples, questions and indicators for the planning and implementing of a process of community-based management. It focuses on small-scale fisheries (freshwater, floodplain, estuarine, or marine) in developing countries but is also relevant to small-scale fisheries in developed countries and to the management of other coastal resources (such as coral reefs, mangroves, sea grass, and wetlands).
